If I were allowed only one Holohan book I would choose *Pumping Away!* This book was written in plain English for Everyman. It's the hydronicians bible and should be the most-often-used, dog-eared book in your collection. A copy at home and in your truck is a must. I can't think of a better Christmas present for your competitors. You know the ones that need them most. :) Buy a dozen or more. - Bob Hot Rod Rohr -- HeatingHelp.com Customer

I wrote this book to describe the beautiful workings of hydronic heating systems and I tried to use words that made the subject spring to life in a visual way. It's been one of my best-selling books for years. I kept the drawings simple. Even if you've never worked with hydronics before, you'll be able to follow these drawings. The first part deals with boiler-room piping and explains how you can put the discoveries of the late, great Gil Carlson to work for you. If you pipe Gil's way, you'll save time, money and never again have to bleed radiators. Thousands of installers have reported great success by following the principles in the first part of this book. I wish I could take credit but the genius was Gil Carlson's. I just did my best to tell his story in plain English. The second half of the book takes the "Pumping Away" boiler-room piping design and applies it to a delicious menu of piping options. This is a book that you'll refer to again and again. It will save you time and money. And I guarantee that. - Dan Holohan

In 1994, Dan wrote two papers bound together in this book

1) "Pumping Away," an easy to understand argument for placing the circulator pump on the outlet/top of the boiler (not the inlet/bottom)

2) "Other Really Cool Piping Options for hydronic systems" a list of set-ups for mixed systems (hot water, hot floor, radiant, baseboard)

Its a humorous and easy read, using examples like shaken pop bottles, and I read half of it last night.

The product is overpriced at \$25 for 1994, and in a big font and widely spaced. This sort of content is usually a pdf report that is available free from energystar.gov or for \$10 via download from a Professional Organization website.

If you've spent some time reading Dan's website/forum Homeheatinghelp.com, you already know most of this book's content. The book goes deeper into "the why" with easy explanations and humor.

I purchased this 1994 book, because modern books really focus on modern hydronics and I wanted something that omits that content. My 1960's boiler released water 3 years ago from the safety valve, and I freaked out like a normal person and called my hydronics contractor. They used it as an excellent opportunity to say "my boiler was worn out" (probably not) and sell me a new boiler. Except its a photocopy of the old one using the same 1960's technology and doesn't have modern efficiency & money saving technologies. It turns out both boilers are operating at nearly 27psi (safety@30) because there are 2 major kinks in my underground hydronic lines. And it constantly fires, because half my pipes run under my basement/underground and the other half run through a vented crawlspace where its 20F in the Winter. So i'll be doing some plumbing this summer (boiler off due to summer heat) to fix that.

Save your money and visit Dan's website instead at homeheatinghelp.com . Otherwise buy this book, and consider it a night at a fun, but slightly overpriced comedy club with a drink included.

Pumping Away has the simple answers!

By Kenneth Walker

This book concisely explains why you want to pump away from the boiler as well as why we have a legacy of doing it wrong. This isn't a maybe or perhaps. Installing hydronic circulators incorrectly leaves a legacy of gurgling pipes and an annual need to bleed hydronic heating systems that isn't necessary, thank you Dan Holohan! This book is a quick read and an excellent reference after read specifically the diagrams. This is my second copy, my first was lent out never to be seen again...
